

## 8. Creating eco-innovations

- creating eco-innovations as a tool to achieve sustainable development and to improve competitiveness of companies with a special regard to the European Commission requirements,
- presenting different types of eco-innovations and proposing ways of their implementation into companies,
- providing tools and methods to implement eco-innovations,
- making an environmental risk assessment of LCA products' life cycle,
- designing eco-innovative products,
- analysing and evaluating products and seeking possibilities of their environmental improvement.

As part of our support, we not only examine the possibilities of implementing eco-innovations in a company, but also assist with the design of new eco-innovative products as well as the processes of their development. We also help a company to evaluate its current situation and examine possibilities of implementing new methods and tools necessary to eco-design. Our support also includes the evaluation of currently manufactured products with a special regard to their impact on the environment. On our training and consulting sessions we advise a company how to create eco-innovative products, including the recycling costs of the products.
